

html2php by GlennSingleton.com

A utility to copy or rename html files to php and rename internal links

1. Rename the attached html2php.zi to html2php.zip
2. Extract the 2 files, html2php.exe and makephp.bat to your export path
3. You can use the html2php.exe at the command prompt

Your export path>html2php

This will copy all .html to .php files and rename all internal links to .php as well. If you add /r to the html2php /r it will rename not copy.

OR

4. Add the makephp.bat to the export settings of Bootstrap Studio

Export Settings

Export Destination

C:\wamp64\www\gs

Export Script

C:\wamp64\www\gs\makephp.bat

Browse

Export scripts are executable scripts or programs, that the app runs every time you export your design. The export destination is passed as arg 1. [Learn more.](#)

5. On export the makephp.bat will perform the html2php in the export directory (and without the /r option) a copy of all .html files will be made as .php and all internal links to .html files will be renamed to .php
